Businesses today have to rely on computer systems, email and electronically stored data to stay in business, as well as to maintain a competitive edge. While necessary to respond to customers and to store data, this technology does not come without a cost. Responding to the loss or theft of information maintaining accurate information on demand can be expensive and the collateral costs staggering. Federal Bureau of Investigation statistics show that nearly nine of out 10 organizations experience computer security incidents in a year's time and over 64% incur a loss.

Mitchell Williams' Information Management & Security practice is concentrated on the areas of data security and electronic discovery issues, security policies and procedures, crisis response plans and data retention policies. We help clients to develop policies and procedures to prevent computer security intrusions and to mitigate them if they occur. The team also helps clients develop procedures to retain and disclose electronically stored information in connection with litigation or audits.
